

Instrument	<b>Delirium Index</b> NOTE: This card is populated with information from the instrument's original validation study only.
Acronym	DI, DIDX
Primary use	Delirium Severity
Area assessed (Number of questions)	7 areas assessed: disorders of attention, thought, consciousness, orientation, memory, perception, psychomotor activity; 7 items total
Description	Observational delirium severity scale that does not require additional information from family members, clinical staff, or medical records; meant to be used in conjunction with the Mini-Mental State Examination (MMSE) and requires use of at least the first five questions of MMSE (can be substituted with similar questions from another cognitive screening tool). DI can be rated one or more times daily.
Versions	1
Scoring information	Each area scored on a scale from 0 (absent) to 3 (present and severe) using operational criteria for each score; total scores range from 0-21 with higher scores indicating higher severity. DI items are scored in conjunction with MMSE (or equivalent cognitive testing questions).
Cognitive testing	DI requires use of the MMSE or another cognitive screening tool to provide a basis for observation; at least the first five questions of MMSE constitute the basis of ratings.
Estimated time to rate	10 mins (estimate)
Require trained rater	Yes – clinician or trained lay rater
Administer to	Patient, in-person
Special resources required	MMSE instrument – copyright restrictions apply, see below for details to obtain. MMSE can be substituted with a similar cognitive screening tool.
How to obtain	Available for download at <a href="http://dx.doi.org/10.1111/j.1532-5415.2004.52471.x">http://dx.doi.org/10.1111/j.1532-5415.2004.52471.x</a> (Note: article may be located behind paywall). MMSE available at <a href="https://www.parinc.com/products/pkey/237">https://www.parinc.com/products/pkey/237</a>
Licensing Fee*	None for instrument; MMSE has licensing fee for use (see link above).
Languages available	English, French
Highest COSMIN** rating	5.5/6 <sup>†</sup>
Test Performance Characteristics	<b>McCusker 2004</b> <ul style="list-style-type: none"> <li>•Reliability (internal consistency, Cronbach's alpha 0.74; inter-rater, intraclass correlation efficient 0.98)</li> <li>•Convergent validity (Compared to MMSE, Spearman correlation coefficients [delirium and dementia patients -0.83; delirium patients only -0.79; dementia patients only -0.78; neither delirium nor dementia -0.66])</li> <li>•Responsiveness (Standardized response mean in delirious patients with dementia/delirious patients without dementia [8-week follow up, -0.64/-0.64; 6 months -0.45/-0.81; 12 months -0.34/-0.51])</li> </ul>

\* Fees and licensing information is effective as of 2018, but is subject to change over time

\*\* COSMIN is used to rate a study's evaluation of a survey or test's measurement properties. COSMIN does NOT rate the instrument itself, but helps readers understand if they can have confidence in the results of studies evaluating measurement properties of surveys and tests. For example, a rigorous study evaluating a test with poor measurement properties will receive a “good” COSMIN rating, while a poorly-conducted study evaluating a test with good measurement properties will receive a “poor” COSMIN rating. Small sample size can impact all COSMIN ratings. You must consider both the COSMIN rating and the results of studies provided when forming your opinion about that test. *COSMIN ratings shown are based solely on the instrument’s original validation study.*

† COSMIN breakdown: inter-rater reliability: FAIR, content validity: GOOD, construct validity: GOOD, external validity: GOOD, internal consistency: GOOD, effect indicators: GOOD
