

## EEG Delirium Assessment: Evolving Research & Clinical Roles

Presenters: Eyal Kimchi, MD, PhD and Gen Shinozaki, MD

Time	Section
01:39	<p><b><u>Delirium is a complex mind/brain syndrome</u></b></p> <ul style="list-style-type: none"> <li>• How to identify delirium? (main methods: DSM-5 and CAM)</li> <li>• Limitations: in routine practice, many cases of delirium go unrecognized</li> <li>• Complex, but not Random (predisposing factors and precipitating factors)</li> </ul>
03:55	<p><b><u>Brain-Based Delirium Measurement?</u></b></p> <ul style="list-style-type: none"> <li>• EEG as a biomarker of delirium and delirium severity</li> <li>• EEG results of someone without and someone with delirium (differences in wave shapes)</li> <li>• Clinical EEG Slowing Correlates with Delirium Severity               <ul style="list-style-type: none"> <li>○ Generalized theta or delta slowing was associated with delirium</li> </ul> </li> <li>• EEG Slowing reflects delirium more than arousal</li> <li>• EEG Slowing is present in patients with Hypoactive and Hyperactive Delirium</li> </ul>
08:08	<p><b><u>EEG Slowing Correlates with Clinical Outcomes</u></b></p> <ul style="list-style-type: none"> <li>• Patients with EEG slowing tend to stay longer in the hospital and patients with clinical delirium also tend to stay longer in the hospital</li> <li>• Patients with EEG slowing tend to have worse clinical outcomes at discharge and patients with delirium also tend to have worse clinical outcomes</li> <li>• Mortality: in this study cohort, only those who developed EEG slowing died</li> </ul>
09:50	<p><b><u>What about EEG features other than slowing?</u></b></p> <ul style="list-style-type: none"> <li>• Routine Clinical EEG Interpretation: looking for any abnormalities in background rhythms               <ul style="list-style-type: none"> <li>○ These rhythms are important for states of arousal</li> <li>○ Usually look for discharges (Epilepsy)</li> </ul> </li> <li>• Visual EEG-Based Grading of Delirium Severity               <ul style="list-style-type: none"> <li>○ 404 patient cohort receiving EEG for Altered Mental Status</li> <li>○ Most visual EEG features are associated with someone's delirium severity (VE-CAM-S)                   <ul style="list-style-type: none"> <li>▪ VE-CAM-S is correlated with mortality in the hospital and up to 3 months</li> </ul> </li> </ul> </li> </ul>
13:35	<p><b><u>What about EEG features that are hard to see?</u></b></p> <ul style="list-style-type: none"> <li>• Machine learning EEG delirium severity prediction</li> <li>• List of EEG features that are now computational in nature and not visual</li> <li>• E-CAM-S: EEG Confusion Assessment Method Severity Score               <ul style="list-style-type: none"> <li>○ Cannot make a clinical diagnosis based on this alone</li> </ul> </li> <li>• Importance of variability of EEG features over time               <ul style="list-style-type: none"> <li>○ Variability of slowing over time, etc. (the visual is showing standard deviations)</li> </ul> </li> <li>• Spatial Topography of Delirium Pathophysiology?               <ul style="list-style-type: none"> <li>○ Front to back brain axis was associated more with a differential rate of delirium than the hemispheres right to left</li> <li>○ Can predict delirium severity based on the electrode pairs</li> <li>○ Antero-Posterior Topography of Delirium: as the antero-posterior distance between the electrodes grows larger the correlation with delirium severity grows</li> <li>○ Matches with quantitative data</li> </ul> </li> </ul>
19:45	<p><b><u>Organization of Delirium Pathophysiology</u></b></p> <ul style="list-style-type: none"> <li>• Slowing is the single most informative EEG feature for delirium (biomarker)</li> <li>• Visual or quantitative EEG features beyond slowing may help predict delirium severity</li> <li>• The variability of EEG features over time may help predict delirium severity</li> <li>• Delirium pathophysiology may particularly involve anterior-posterior cortical brain networks</li> </ul>
21:14	<p><b><u>Some EEG Advantages &amp; Limitations</u></b></p> <ul style="list-style-type: none"> <li>• Advantages</li> </ul>

	<ul style="list-style-type: none"> <li>○ Applicable at the bedside</li> <li>○ Reflects core delirium features</li> <li>○ Validity across phenotypes (hypoactive &amp; hyperactive)</li> <li>○ Quantitative data</li> <li>○ High temporal resolution</li> <li>● Limitations <ul style="list-style-type: none"> <li>○ Something is placed on the patient</li> <li>○ Spatial limitations (samples large brain regions, sample primarily superficial cortex)</li> <li>○ Limited etiologic information</li> <li>○ Traditionally requires expertise (placement of EEG, interpretation of EEG)</li> </ul> </li> </ul>
25:17	<b><u>Game-changing approach for delirium: Novel EEG algorithm for detection and outcome prediction</u></b>
25:35	<b><u>Publications</u></b>
25:48	<b><u>Question</u></b> <ul style="list-style-type: none"> <li>● Why do we measure blood pressure?—look for at risk people to do something to help them</li> <li>● How about glucose?</li> <li>● Imagination: think of a family member who may be admitted to a hospital</li> </ul>
27:05	<b><u>The CAM-ICU</u></b>
27:29	<b><u>Traditional EEG</u></b> <ul style="list-style-type: none"> <li>● Delirium can be detected by a traditional EEG <ul style="list-style-type: none"> <li>○ But, not practical for every pt even with high risk</li> <li>○ Machine is too big</li> <li>○ Technician needs to place multiple leads</li> <li>○ Neurology specialist to interpret</li> </ul> </li> <li>● EEG findings for delirium <ul style="list-style-type: none"> <li>○ EEG findings are “diffuse slowing” = slow wave (delta-theta) across all 20 leads <ul style="list-style-type: none"> <li>▪ No need for 20 leads to detect diffuse slowing</li> <li>▪ Only a few leads are enough</li> <li>▪ It is proven through systematic evaluation of many EEG pairs</li> </ul> </li> </ul> </li> <li>● Used in other areas <ul style="list-style-type: none"> <li>○ Anesthesiology (monitoring for depth of anesthesia, BIS monitor, Entropy, etc.)</li> <li>○ ECT machine (monitoring for seizure activities)</li> </ul> </li> </ul>
29:44	<b><u>Delirium EEG Study</u></b> <ul style="list-style-type: none"> <li>● To test if a simplified EEG device can detect delirium among elderly high risk patients</li> <li>● To test if a simplified device can detect delirium before clinical identification</li> <li>● 20 leads vs. 2 leads</li> <li>● Study design and participants <ul style="list-style-type: none"> <li>○ Study design prospective observational study, no intervention <ul style="list-style-type: none"> <li>▪ Simple EEG device monitoring twice a day</li> <li>▪ Digital signal processing algorithm</li> <li>▪ DRS, DOSS, and CAM-ICU twice a day</li> </ul> </li> <li>○ Study population (2016-2019) <ul style="list-style-type: none"> <li>▪ Initial two cohorts at high risk for delirium (orthopedic surgery pts and older adult general medicine pts)</li> </ul> </li> <li>○ Demographics of study cohort</li> <li>○ Device: “Palm-sized” device and put a few electrodes on forehead</li> </ul> </li> </ul>
31:46	<b><u>EEG signals and spectral density analysis</u></b> <ul style="list-style-type: none"> <li>● Example of data</li> <li>● BSEEG score—time series: the higher you go, there is more slow waves <ul style="list-style-type: none"> <li>○ Comparing delirium case to non-delirium case</li> </ul> </li> </ul>
33:08	<b><u>Initial group analysis from 45 cases</u></b>

	<ul style="list-style-type: none"> <li>• Can see the difference between delirium and non-delirium</li> <li>• ROC analysis from test dataset <ul style="list-style-type: none"> <li>◦ Chose BSEEG score of 1.44 as the cut off (positive &gt;1.44, negative &lt;1.44)</li> </ul> </li> <li>• Validation 1 from inpatient</li> <li>• Validation 2 from ER</li> <li>• Validation 3 from ECT <ul style="list-style-type: none"> <li>◦ ECT case monitoring over 2 hours</li> </ul> </li> </ul>
34:40	<p><b><u>New device tested</u></b></p> <ul style="list-style-type: none"> <li>• More user friendly and simpler and had a thumb sized one</li> <li>• Validation 5 with a new device BSEEG score can quantify severity</li> </ul>
35:10	<p><b><u>Can EEG predict delirium onset?</u></b></p> <ul style="list-style-type: none"> <li>• Negative case</li> <li>• Positive case (EEG score changes 2 days earlier)</li> </ul>
36:03	<p><b><u>Delirium, poor outcomes, and EEG</u></b></p> <ul style="list-style-type: none"> <li>• Infographic of this relationship → goes back to the question if EEG can predict outcomes?</li> </ul>
36:29	<p><b><u>Outcomes and BSEEG score</u></b></p> <ul style="list-style-type: none"> <li>• LOS and BSEEG scores were significantly correlated</li> <li>• Discharge outcome and BSEEG scores were significantly associated</li> <li>• Delirium and mortality</li> <li>• Can EEG predict mortality? <ul style="list-style-type: none"> <li>◦ BSEEG low vs. BSEEG high</li> </ul> </li> <li>• Power of objective phenotyping <ul style="list-style-type: none"> <li>◦ Clinical category vs. EEG category</li> </ul> </li> <li>• Dose dependent effect (BSEEG low vs. BSEEG middle vs. BSEEG high)</li> <li>• EEG x Delirium category and Mortality (purple= Delirious and EEG positive; blue= delirious but EEG negative; orange= not delirious and EEG negative; green=not delirious but EEG positive) <ul style="list-style-type: none"> <li>◦ Consistent with hospital mortality → EEG matters!</li> </ul> </li> </ul>
40:47	<p><b><u>“Diffuse slowing” in EEG finding and mortality</u></b></p> <ul style="list-style-type: none"> <li>• Normal vs. diffuse slowing</li> </ul>
41:25	<p><b><u>Dementia and BSEEG</u></b></p> <ul style="list-style-type: none"> <li>• Orange= no dementia &amp; low BSEEG; Green= no dementia &amp; high BSEEG; Blue= dementia &amp; low BSEEG; Purple= dementia &amp; high BSEEG</li> </ul>
42:15	<p><b><u>Sepsis and BSEEG</u></b></p> <ul style="list-style-type: none"> <li>• Was able to differentiate mortality, dose-dependent manner</li> </ul>
42:45	<p><b><u>Another replication with a new device</u></b></p> <ul style="list-style-type: none"> <li>• Validated with 1,077 subjects</li> <li>• All delirious patients are not the same</li> <li>• Motor subtype? <ul style="list-style-type: none"> <li>◦ Hypo-active vs. Hyper-active</li> </ul> </li> </ul>
44:07	<p><b><u>Circling back to beginning of Gen’s talk</u></b></p> <ul style="list-style-type: none"> <li>• Imagination of family member in hospital</li> <li>• Question: <ul style="list-style-type: none"> <li>◦ Why do we measure blood pressure?</li> <li>◦ How about glucose?</li> <li>◦ <b>Based on this data why not BSEEG?</b></li> </ul> </li> </ul>
44:27	<p><b><u>Summary</u></b></p> <ul style="list-style-type: none"> <li>• Delirium is a dangerous condition</li> <li>• Early detection is vital for better outcomes</li> <li>• Current methods are not practical</li> </ul>

	<ul style="list-style-type: none"> <li>• Simplified EEG can detect delirium early</li> <li>• Easy to use for busy hospital settings</li> <li>• This approach would benefit patients, physicians, hospitals, and health economy</li> </ul>
44:50	<p><b><u>Future Directions</u></b></p> <ul style="list-style-type: none"> <li>• I envision this BSEEG score to be used as “next vital sign”. Used every day, every patient, in the hospitals, clinics, and nursing homes.</li> <li>• A thumb-size, newer device being tested</li> <li>• Real goal is to bring this technology to the patients</li> <li>• Peri-operative protocol in 2030? (getting baseline BSEEG and then post-op BSEEG)</li> </ul>
46:32	<b><u>Questions and Answers</u></b>
